Since the first sailing ships spied the Antarctic coastline in 1820, the frozen continent has captured the world's imagination. David Day's brilliant biography of Antarctica describes in fascinating detail every aspect of this vast land's history--two centuries of exploration, scientific investigation, and contentious geopolitics. Drawing from archives from around the world, Day provides a sweeping, large-scale history of Antarctica. Focusing on the dynamic personalities drawn to this unconquered land, the book offers an engaging collective biography of explorers and scientists battling the elements in the most hostile place on earth. We see intrepid sea captains picking their way past icebergs and pushing to the edge of the shifting pack ice, sanguinary sealers and whalers drawn south to exploit "the Penguin El Dorado," famed nineteenth-century explorers like Scott and Amundson in their highly publicized race to the South Pole, and aviators like Clarence Ellsworth and Richard Byrd, flying over great stretches of undiscovered land. Yet Antarctica is also the story of nations seeking to incorporate the Antarctic into their national narratives and to claim its frozen wastes as their own. As Day shows, in a place as

remote as Antarctica, claiming land was not just about seeing a place for the first time, or raising a flag over it; it was about mapping and naming and, more generally, knowing its geographic and natural features. And ultimately, after a little-known decision by FDR to colonize Antarctica, claiming territory meant establishing full-time bases on the White Continent. The end of the Second World War would see one last scramble for polar territory, but the onset of the International Geophysical Year in 1957 would launch a cooperative effort to establish scientific bases across the continent. And with the Antarctic Treaty, science was in the ascendant, and cooperation rather than competition was the new watchword on the ice. Tracing history from the first sighting of land up to the present day, Antarctica is a fascinating exploration of this deeply alluring land and man's struggle to claim it.

In *Malamute Man: Memoirs of an Arctic Traveler*, Joe Henderson, who came to Alaska in search of adventure, finds himself on a remarkable journey exploring the Arctic with his Alaskan malamute sled dog team. He ventures into one of the most brutal environments on earth where extreme subzero temperatures are a constant reminder of mortality, and the will to survive is unselfishly shared by both man and dog. Together, they must fend off charging grizzly bears, endure powerful blizzards, and suffer the horror of plunging through thin ice. Joe's gripping tales of perseverance and his fearless, free-spirited dogs are both humorous and

It was meant to be a great day. Several centuries into the future, the world has finally come together under a single government, the Executive Committee. They provide for the rest of humanity, most of whom live in huge arcologies - enormous tower block cities. The New Argo, has been sent to colonise a distant planet - code-named Gamma Six. The day it got there should have been a great one for humanity. Instead, upon reaching the planet, the New Argo blows up. But why don't the members of the Executive Committee want to investigate? And what really happened to the New Argo? These are the questions that Lize Carr, youngest member of the Committee, wants answered. When she employs private detective Kem Logan to investigate she unwittingly starts a chain of events that will mean danger for a great many people, including Kem and herself. This sensational tale from action-adventure master James Fenimore Cooper takes the form of the life story of a rugged old sailor, Miles Wallingford. As a youth, Miles, his brother, and their slave Neb ran away from the family home to become seamen, dashing the family's hopes that Miles will become a respectable lawyer. Veering wildly from calamities to courageous feats and back again, *Afloat and Ashore* is one sea tale you won't soon forget.

From dirt bikes and jet skis to weed wackers and snowblowers, machines powered by small gas engines have become a permanent—and loud—fixture in American culture. But fifty years of high-speed fun and pristine lawns have not come without cost. In the first comprehensive history of the small-bore engine and the technology it powers, Paul R. Josephson explores the political, environmental, and public health issues surrounding one of America's most dangerous pastimes. Each chapter tells the story of an ecosystem within the United States and the devices that wreak havoc on it—personal watercraft (PWCs) on inland lakes and rivers; all-terrain vehicles (ATVs) in deserts and forests; lawn mowers and leaf blowers in suburbia. In addition to environmental impacts, Josephson discusses the development and promotion of these technologies, the legal and regulatory efforts made to improve their safety and environmental soundness, and the role of owners' clubs in encouraging responsible operation. Synthesizing information from medical journals, recent environmental

research, nongovernmental organizations, and manufacturers, Josephson's compelling history leads to one irrefutable conclusion: these machines cannot be operated without loss of life and loss of habitat.

The remarkable story of the heroic effort to save and preserve Afghanistan's wildlife-and a culture that derives immense pride and a sense of national identity from its natural landscape. Postwar Afghanistan is fragile, volatile, and perilous. It is also a place of extraordinary beauty. Evolutionary biologist Alex Dehgan arrived in the country in 2006 to build the Wildlife Conservation Society's Afghanistan Program, and preserve and protect Afghanistan's unique and extraordinary environment, which had been decimated after decades of war. Conservation, it turned out, provided a common bond between Alex's team and the people of Afghanistan. His international team worked unarmed in some of the most dangerous places in the country-places so remote that winding roads would abruptly disappear, and travel was on foot, yak, or mule. In *The Snow Leopard Project*, Dehgan takes readers along with him on his adventure as his team helps create the country's first national park, completes the some of the first extensive wildlife surveys in thirty years, and works to stop the poaching of the country's iconic endangered animals, including the elusive snow leopard. In doing so, they help restore a part of Afghan identity that is ineffably tied to the land itself.

This book also includes information on how the Bengal cat compares to other similar exotic breeds of cats that have "wild" cat ancestors from a few generations back, as well as TICA information, and legal considerations specifically for USA, Canada and the UK. In parts of Korea and China, moon bears, black but for the crescent-shaped patch of white on their chests, are captured in the wild and brought to "bear farms" where they are imprisoned in squeeze cages, and a steel catheter is inserted into their gall bladders. The dripping bile is collected as a cure for ailments ranging from an upset stomach to skin burns. The bear may live as long as fifteen years in this state. Rhinos are being illegally poached for their horns, as are tigers for their bones, thought to improve virility. Booming economies and growing wealth in parts of Asia are increasing demand for these precious medicinals. Already endangered species are being sacrificed for temporary treatments for nausea and erectile dysfunction. Richard Ellis, one of the world's foremost experts in wildlife extinction, brings his alarm to the pages of Tiger Bone & Rhino Horn, in the hope that through an exposure of this drug trade, something can be done to save the animals most direly threatened. Trade in animal parts for traditional Chinese medicine is a leading cause of species endangerment in

Asia, and poaching is increasing at an alarming rate. Most of traditional Chinese medicine relies on herbs and other plants, and is not a cause for concern. Ellis illuminates those aspects of traditional medicine, but as wildlife habitats are shrinking for the hunted large species, the situation is becoming ever more critical. One hundred years ago, there were probably 100,000 tigers in India, South China, Sumatra, Bali, Java, and the Russian Far East. The South Chinese, Caspian, Balinese, and Javan species are extinct. There are now fewer than 5,000 tigers in all of India, and the numbers are dropping fast. There are five species of rhinoceros--three in Asia and two in Africa--and all have been hunted to near extinction so their horns can be ground into powder, not for aphrodisiacs, as commonly thought, but for ailments ranging from arthritis to depression. In 1930, there were 80,000 black rhinos in Africa. Now there are fewer than 2,500. Tigers, bears, and rhinos are not the only animals pursued for the sake of alleviating human ills--the list includes musk deer, sharks, saiga antelope, seahorses, porcupines, monkeys, beavers, and sea lions--but the dwindling numbers of those rare species call us to attention. Ellis tells us what has been done successfully, and contemplates what can and must be done to save these animals or, sadly, our children will witness the extinction of tigers, rhinos, and moon bears in their lifetime. Did you know that European royalty once used cheetahs to hunt deer, or that caracals can capture birds by leaping six and a half feet straight up into the air from a standing start? Have you ever wondered whether domestic cats really do land on their feet when they fall, or how Canada lynx can stalk their prey in the winter without falling through the deep snow? Wild Cats of the World is a treasure trove of answers to questions like these, and many others, for anyone who's interested in learning more about the world's felids, including the ones with whom we share our homes. Mel and Fiona Sunquist

have spent more than a decade gathering information about cats from every available source, many of them quite difficult to find, including scientific papers, descriptions of hunts, archeological findings, observations by naturalists and travelers, reports from government agencies, and newsletters from a wide variety of organizations. Weaving information from these sources together with their own experiences observing wild cats around the world, the Sunquists have created the most comprehensive reference on felids available. Each of their accounts of the 36 species of cat contains a description of the cat, including human interactions with it, as well as detailed data on its distribution, ecology and behavior, status in the wild, and efforts to conserve it. Numerous photographs, including more than 40 in full color, illustrate these accounts. Ranging from the two-pound black-footed cat to the five-hundred-pound tiger, and from the African serval with its satellite-dish ears to the web-footed fishing cat of Asia, *Wild Cats of the World* will fascinate and educate felid fans of any stripe (or spot).

Edible insects have always been a part of human diets, but in some societies there remains a degree of disdain and disgust for their consumption. Insects offer a significant opportunity to merge traditional knowledge and modern science to improve human food security worldwide. This publication describes

the contribution of insects to food security and examines future prospects for raising insects at a commercial scale to improve food and feed production, diversify diets, and support livelihoods in both developing and developed countries. Edible insects are a promising alternative to the conventional production of meat, either for direct human consumption or for indirect use as feedstock. This publication will boost awareness of the many valuable roles that insects play in sustaining nature and human life, and it will stimulate debate on the expansion of the use of insects as food and feed.
