Arthur McIvor and Ronald Johnston explore the experience of coal miners' lung diseases and the attempts at voluntary and legal control of dusty conditions in British mining from the late nineteenth century to the present. In this way, the book addresses the important issues of occupational health and safety within the mining industry; issues that have been severely neglected in studies of health and safety in general. The authors examine the prevalent diseases, notably pneumoconiosis, emphysema and bronchitis, and evaluate the roles of key players such as the doctors, management and employers, the state and the trade unions. Throughout the book, the integration of oral testimony helps to elucidate the attitudes of workers and victims of disease, their 'machismo' work culture and socialisation to very high levels of risk on the job, as well as how and why ideas and health mentalities changed over time. This research, taken together with extensive archive material, provides a unique perspective on the nature of work, industrial relations, the meaning of masculinity in the workplace and the wider social impact of industrial disease, disability and death. The effects of contracting dust disease are shown to result invariably in seriously prescribed lifestyles and encroaching isolation. The book will appeal to those working on the history of medicine, industrial relations, social history and business history as well as labour history.

Negative environmental events make the headlines. Mining industry examples are the recent incidents at Summitville, Colorado, US, and the cyanide leak at Cambria Resource's Omai Operation in Guyana. In this volatile atmosphere, the publication of the Mining Environmental Handbook comes at an opportune time. It presents an objective, comprehensive and integrated examination of the effects of mining on the environment, and the environmental laws that deal with mining. Though stressing activities in the United States of America, it covers all of North America. North American environmental standards are currently being exported around the world. Consequently, this handbook will be of prime interest in countries that are now coming to terms with mining environmentalism. It should benefit working engineers and environmentalists, manufacturers, legislators, regulators, financiers and journalists. It has been selected as a university textbook. Finally, it will be an indispensable reference during serious discussions about mining environmentalism. Contents: Development of the Mine Environmental Precept and Its Current Political Status The Legal Bases of Federal Environmental Control of Mining Environmental Control at the State Level Environmental Effects of Mining Technologies for Environmental Protection Environmental Permitting Systems Design for Site Specific Environmental Protection Operations Environmental Management Solution Mining and In-Situ Leaching Placer or Alluvial Mining Coal Acid Mine Drainage and Other Mining-Influenced Waters (MIW) Uses of Mines as Landfills and Repositories Economic Impact of Current Environmental Regulations on Mining Financial Assurances for Corrective Actions, Closure and Post Closure International Environmental Control of Mining Environmental Case Studies from the Hard Rock Industry Current and Projected Issues Directory of State Regulatory Agencies Glossary Index Readership: Engineers, environmentalists and geologists. Aspects; Problems; Technology; Permitting; Case Studies; Economic Impact Reviews: "... is a useful, and very readable, first point of reference for those needing to have a general overview of the various environmental issues arising from mining and mineral processing ... There is much to commend the book to wider international use, as it contains a considerable amount of universal 'best practice' which can be applied to mining situations in most countries seeking to adopt credible western standards." Uranium mining in the Commonwealth of Virginia has been prohibited since 1982 by a state moratorium, although approval for restricted uranium exploration in the state was granted in 2007. Uranium Mining in Virginia examines the scientific, technical, environmental, human health and safety, and regulatory aspects of uranium mining, milling, and processing as they relate to the Commonwealth of Virginia for the purpose of assisting the Commonwealth to determine whether uranium mining, milling, and processing can be undertaken in a manner that safeguards the environment, natural and historic resources, agricultural lands, and the health and well-being of its citizens. According to this report, if Virginia lifts its moratorium, there are "steep hurdles to be surmounted" before mining and processing could take place within a regulatory setting that appropriately protects workers, the public, and the environment, especially given that the state has no experience regulating mining and processing of the radioactive element. The authoring committee was not asked to recommend whether uranium mining should be permitted, or to consider the potential benefits to the state were uranium mining to be pursued. It also was not asked to compare the relative risks of uranium mining to the mining of other fuels such as coal. This book will be of interest to decision makers at the state and local level, the energy industry, and concerned citizens.

This book describes hazards from radon progeny and other alpha-emitters that humans may inhale or ingest from their environment. In their analysis, the authors summarize in one document clinical and epidemiological evidence, the results of animal studies, research on alpha-particle damage at the cellular level, metabolic pathways for internal alpha-emitters, dosimetry and microdosimetry of radionuclides deposited in specific tissues, and the chemical toxicity of some low-specific-activity alpha-emitters. Techniques for estimating the risks to humans posed by radon and other internally deposited alpha-emitters are offered, along with a discussion of formulas, models, methods, and the level of uncertainty inherent in the risk estimates.

With the growing use of information technology and the recent advances in web systems, the amount of data available to users has increased exponentially. Thus, there is a critical need to understand the content of the data. As a result, data-mining has become a popular research topic in recent years for the treatment of the "data rich and information poor" syndrome. In this carefully edited volume a theoretical foundation as well as important new directions for data-mining research are presented. It brings together a set of well respected data mining theoreticians and researchers with practical data mining experiences. The presented theories will give data mining practitioners a scientific perspective in data mining and thus provide more insight into their problems, and the provided new data mining topics can be expected to stimulate further research in these important directions.

than 100 years. According to U.S. Energy Information Administration projections to 2050, coal is expected to be an important energy resource for the United States. Additionally, metallurgical coal used in steel production remains an important national commodity. However, coal production, like all other conventional mining activities, creates dust in the workplace. Respirable coal mine dust (RCMD) comprises the size fraction of airborne particles in underground mines that can be inhaled by miners and deposited in the distal airways and gas-exchange region of the lung. Occupational exposure to RCMD has long been associated with lung diseases common to the coal mining industry, including coal workers' pneumoconiosis, also known as "black lung disease." *Monitoring and Sampling Approaches to Assess Underground Coal Mine Dust Exposures* compares the monitoring technologies and sampling protocols currently used or required by the United States, and in similarly industrialized countries for the control of RCMD exposure in underground coal mines. This report assesses the effects of rock dust mixtures and their application on RCMD measurements, and the efficacy of current monitoring technologies and sampling approaches. It also offers science-based conclusions regarding optimal monitoring and sampling strategies to aid mine operators' decision making related to reducing RCMD exposure to miners in underground coal mines.

This book is a remarkable case study of an environmental policy initiative for a national environmental regulatory system in the information age. In 1995 the Indonesian Ministry of Environment took the bold step to launch an environmental disclosure initiative called the Program for Pollution Control, Evaluation and Rating (PROPER). Under PROPER, environmental performance of companies is mapped into a five-color grading scale - Gold for excellent, Green for very good, Blue for good, Red for non-compliance, and Black for causing environmental damage. These ratings are then publicly disclosed through a formal press conference and posted on the internet. Not only did this simple rating scheme create a major media buzz and enhanced environmental awareness of the general public, but it also unleashed a wide range of performance incentives that showed how markets with environmental information could function in a developing country setting. The authors provide a multidisciplinary analysis of how the PROPER program harnessed the power of public disclosure to abate the problem of industrial pollution. They describe how the program has successfully improved the average environmental compliance rate from close to thirty per cent in 1995 to as high as seventy per cent in 2011. This improvement was driven primarily by information disclosure, which avoided expensive and unpredictable legal enforcement through the court system of Indonesia. The combination of institutional history and detailed economic and analyses sheds light on the role of policy entrepreneurs who laid the foundation for disclosure and transparency, despite the constraints of the Suharto regime. The PROPER program is now internationally recognized and continues to serve as a model for many developing countries.
