Design and manufacturing is the essential element in any product development lifecycle. Industry vendors and users have been seeking a common language to be used for the entire product development lifecycle that can describe design, manufacturing and other data pertaining to the product. Many solutions were proposed, the most successful being the Stadndard for Exchange of Product model (STEP). STEP provides a mechanism that is capable of describing product data, independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange, but also as a basis for implementing, sharing and archiving product databases. ISO 10303-AP203 is the first and perhaps the most successful AP developed to exchange design data between different CAD systems. Going from geometric data (as in AP203) to features (as in AP224) represents an important step towards having the right type of data in a STEP-based CAD/CAM system. Of particular significance is the publication of STEP-NC, as an extension of STEP to NC, utilising feature-based concepts for CNC machining purposes. The aim of this book is to provide a snapshot of the recent research outcomes and implementation cases in the field of design and manufacturing where STEP is used as the primary data representation protocol. The 20

chapters are contributed by authors from most of the top research teams in the world. These research teams are based in national research institutes, industries as well as universities. Comes with a CD-ROM packed with a variety of problem-solving projects.

This book is designed for students and teachers who are looking for a programming course based on ISO standard language, with a special focus on numerically controlled lathes and in combination with a software able to reproduce a real NC on the computer and to perform a graphic simulation of the program created. The course, which is centered on a three-axis lathe (X, Z, C) with driven tools, is subdivided into 50 course hours. The license for the free use of the training and graphic simulation software, which may be downloaded from the Internet according to the instructions provided in the book, has a validity of sixty days. The total number of hours necessary for its completion will always be specified at the beginning of each chapter. This will allow the user to select the topics to be covered based on available time and to assess progress achieved by completion of the exercises within set timeframes. All the programs used during the explanations and the collection of the images contained in the book, which may be printed, viewed or displayed during the course at home or in the classroom may be downloaded from the website: cncwebschool.com. At the end of the course, the concepts applied to the programming of the lathe will be used to program a three-axis vertical mill (X, Y, Z). Finally, the book contains a list of technical terms and their translation from English into Italian and German.

Second edition. Revised and updated (January 2021). With free graphic simulation software, upgrade of procedures and images. This book is designed for students and teachers who are looking for a programming course in combination with a graphic simulation software. The course is based on the understanding of the 'ISO Standard' functions, i.e. the programming language at the basis of all numeric controls. The training and simulating software faithfully replicates a real numeric control on your computer. This course comprises chapters and paragraphs for both theoretical and practical learning. Paragraphs on theory contain drawings and diagrams that simplify the understanding of the text. The first practical experiences consist in the utilization of pre-drafted programs, which are useful to the participant's initial understanding of the numeric control and its potential. Later you will learn how to write new programs with difficulty levels that are commensurate to the acquired experience. During the practical exercises the reader is constantly guided by the respective operating procedures. The learning method has been developed so that even beginners may complete the course and understand all the most complex functions and programming methods. Periodical tests are offered in order to help the students and teachers assess progress achieved or to highlight the topics for review. This is a fifty-hour course. The total number of hours necessary for the understanding of the theoretical part and for carrying out the practical exercises will always be specified at the beginning of each chapter. The course is centered on a three-axis lathe (X, Z, C) with driven tools, then the concepts applied to the programming of the lathe will be used to program a three-axis vertical mill (X, Y, Z). All the programs used during the explanations and the collection of the images contained in the book, which may be printed, viewed or displayed during the course at home or in the classroom may be downloaded from the website cncwebschool.com. Finally the book contains a list of technical terms and their translation from English into Italian and German.

If you?ve spent any amount of time in manufacturing, you know that efficiency matters. Michael Cope, the author of this book, was co-owner of a job shop before he joined Hurco. As a machinist and applications engineer, he always evaluates the most efficient way to approach a part to minimize setup time and reduce cycle time. It's just part of his DNA. That's precisely why he is such a proponent of 5-axis CNC. Adopting a 5-sided machining process is the most efficient way to instantly increase the profit margin on existing jobs that you manufacture on a conventional 3-axis machine. In this book, Mike breaks down the information about 5-axis and 5-sided machining from a machinist's perspective. Whether you?re just learning about 5-axis machining or you?re already adept at 5-axis, you?ll learn something new. A great go-to book written for machinists by a machinist.
