This companion volume to Economic Instruments for Environmental Management presents essential information on the applications of economic valuation to environment and development. It draws on a three-year collaborative effort by research institutions around the world. Authoritative studies review the range of valuation methods used in developing economies, their purposes, the problems encountered and the quality of the results. Topics covered include the value of wildlife viewing, the conservation of rainforests, mangroves and coral reefs, supplying rural water, and controlling urban air pollution. The analysis reveals important methodological and contextual factors, highlighting key lessons and ways of strengthening future valuations. Written to be accessible to non-economists, the book provides source material for students and academics, and for policy-makers and professionals, using valuation methods to frame policy. Originally published in 1987, Cost-Benefit Analysis in Urban and Regional Planning, outlines the theory and practice of cost-benefit analysis (CBA) in the context of urban and regional planning. The theory of CBA is developed with examples to illustrate the principles, it also deals with details of the applications and covers issues such as local health and social services provision, local economic development and regional policy evaluation, and planning in less developed countries – as well as the conventional land-use issues of physical planning.

Every four years since 2004, the Copenhagen Consensus Center has organized and hosted a high profile thought experiment about how a hypothetical extra \$75 billion of development assistance money might best be spent to solve twelve of the major crises facing the world today. Collated in this specially commissioned book, a group of more than 50 experts make their cases for investment, discussing how to combat problems ranging from armed conflicts, corruption and trade barriers, to natural disasters, hunger, education and climate change. For each case, 'Alternative Perspectives' are also included to provide a critique and make other suggestions for investment. In addition, a panel of senior economists, including four Nobel Laureates, rank the attractiveness of each policy proposal in terms of its anticipated cost-benefit ratio. This thought-provoking book opens up debate, encouraging readers to come up with their own rankings and decide which solutions are smarter than others.

A unique presentation of the basics that are needed to understand cost-benefit analysis and put it to immediate use.

This volume is one of a number of publications to carry the results of the first research programme of the Royal Swedish Academy of Science's Beijer Institute. The Institute was formed in 1991 in order to promote interdisciplinary research between natural and social scientists on the interdependency between economic and ecological systems. In its first research programme, the Biodiversity Programme, the Institute brought together a number of leading economists and ecologists to address the theoretical and policy issues associated with the current high rates of biodiversity loss in such systems - whether the result of direct depletion, the destruction of habitat, or specialisation in agriculture, forestry and fisheries. | This volume reports some of the more policy-oriented work carried out under the programme. The broad aim of the programme is to further our understanding of the causes and consequences of biodiversity loss, and to identify the options for addressing the problem. The results have turned out to be surprising to those who see biodiversity loss primarily in terms of the erosion of the genetic library. In various ways the work carried out under the programme has already begun to alter our perception of where the problem in biodiversity loss lies and what policy options are available to deal with it. Indeed, the programme has provided a powerful set of arguments for reappraising not just the economic and ecological implications of biodiversity loss, but the whole case for development based on specialisation of resource use. Agriculture, in addition to producing food, hides and fibre, also provides many other goods and services not priced in the market. These include environmental outputs such as rural amenities and disamenities, but also social and cultural functions. The economic value of these non-market goods and services of agriculture can be assessed by estimating how much purchasing power people would be willing to give up to acquire those outputs if they were forced to make a choice. The contingent valuation method (CVM) is one of the most widely used methodologies developed for the measurement of the value of non-market goods.
