The Future of Nursing explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in number, nurses make up the single largest segment of the health care work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who pursue doctorates. Furthermore, regulatory and institutional obstacles -- including limits on nurses' scope of practice -- should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing.

JOHN S. MILLIS In 1966 the Citizens Commission on Graduate Medical Education observed that the explosive growth in biomedical science and the consequent increase in medical skill and technology of the twentieth century had made it possible for physicians to respond to the episodes of illness of patients with an ever-increasing effectiveness, but that the increase in knowledge and technology had forced most physicians to concentrate upon a disease entity, an organ or organ system, or a particular mode of diagnosis or therapy. As a result there had been a growing lack of continuing and comprehensive patient care. The Commission expressed the opinion that "Now, in order to bring medicine's enhanced diagnostic and therapeutic powers fully to the benefit of society, it is necessary to have many physicians who can put medicine together again. " The Commission proceeded to recommend the education and training of substantial numbers of Primary Physicians who would, by assuming primary responsibility for the patient's welfare in sickness and in health, provide continuing and comprehensive health care to the citizens of the United States. In 1978 it is clear that the recommendation has been accepted by the public, the medical profession, and medical education. There has been a vigorous response in the development of family medicine and in the fields of internal medicine, pediatrics, and obstetrics. One is particularly impressed by the wide acceptance on the part of medical students of the concept of the primary physician. Dr. John S.

In 1996, the Institute of Medicine (IOM) released its report *Telemedicine: A Guide to Assessing Telecommunications for Health Care*. In that report, the IOM Committee on Evaluating Clinical Applications of Telemedicine found telemedicine is similar in most respects to other technologies for which better evidence of effectiveness is also being demanded. Telemedicine, however, has

some special characteristics-shared with information technologies generally-that warrant particular notice from evaluators and decision makers. Since that time, attention to telehealth has continued to grow in both the public and private sectors. Peer-reviewed journals and professional societies are devoted to telehealth, the federal government provides grant funding to promote the use of telehealth, and the private technology industry continues to develop new applications for telehealth. However, barriers remain to the use of telehealth modalities, including issues related to reimbursement, licensure, workforce, and costs. Also, some areas of telehealth have developed a stronger evidence base than others. The Health Resources and Service Administration (HRSA) sponsored the IOM in holding a workshop in Washington, DC, on August 8-9 2012, to examine how the use of telehealth technology can fit into the U.S. health care system. HRSA asked the IOM to focus on the potential for telehealth to serve geographically isolated individuals and extend the reach of scarce resources while also emphasizing the quality and value in the delivery of health care services. This workshop summary discusses the evolution of telehealth since 1996, including the increasing role of the private sector, policies that have promoted or delayed the use of telehealth, and consumer acceptance of telehealth. The Role of Telehealth in an Evolving Health Care Environment: Workshop Summary discusses the current evidence base for telehealth, including available data and gaps in data; discuss how technological developments, including mobile telehealth, electronic intensive care units, remote monitoring, social networking, and wearable devices, in conjunction with the push for electronic health records, is changing the delivery of health care in rural and urban environments. This report also summarizes actions that the U.S. Department of Health and Human Services (HHS) can undertake to further the use of telehealth to improve health care outcomes while controlling costs in the current health care environment.

Heirs of General Practice is a frieze of glimpses of young doctors with patients of every age—about a dozen physicians in all, who belong to the new medical specialty called family practice. They are people who have addressed themselves to a need for a unifying generalism in a world that has become greatly subdivided by specialization, physicians who work with the "unquantifiable idea that a doctor who treats your grandmother, your father, your niece, and your daughter will be more adroit in treating you." These young men and women are seen in their examining rooms in various rural communities in Maine, but Maine is only the example. Their medical objectives, their successes, the professional obstacles they do and do not overcome are representative of any place family practitioners are working. While essential medical background is provided, McPhee's masterful approach to a trend significant to all of us is replete with affecting, and often amusing, stories about both doctors and their charges.
