Parenteral nutrition in general is required if nutritional needs cannot be met by oral or enteral feeding. In the paediatric patient, its initiation depends both on individual circumstances and the age and size of the infant or child. This compact reference work on parenteral nutrition in children is based on the 'Guidelines for Paediatric Parenteral Nutrition' that have been developed jointly by the European Society for Paediatric Gastroenterology, Hepatology and Nutrition (ESPGHAN) and the European Society for Clinical Nutrition and Metabolism (ESPEN), in collaboration with the European Society for Paediatric Research (ESPR). These guidelines were based on systematic literature reviews as well as a formal consensus process of a multidisciplinary panel of professionals. However, as a result of the scarcity of good quality clinical trials in children, many of the recommendations were extrapolated from adult studies and based on expert opinion. A detailed analysis of the available data was performed, and for each statement, the level of evidence and grade of recommendation was assessed. This reference guide has been conceived as an aid for the treating physician to assist him in the decision process, thus being a valuable companion in clinical practice.

This book covers dietetic management of common as well as uncommon diseases of childhood. The chapters on diabetes mellitus, kidney disorders, celiac disease and enteral feeding need special mention as examples of sound instructions. Rare disorders like inborn errors of metabolism are also covered. This book is useful guide for all trainers involved in the teaching of nutrition in colleges and other health care institutions.

This handbook provides an overview of the latest science of the influence of nutrition on blood cells and blood diseases. Blood diseases include a broad range of nutritional deficiencies, leukemias and genetic mutations, associated with an increased risk of infections. Reduced red blood cell production can lead to nutritional diseases and anemias, requiring iron supplementation. Patients with anemia feel sick, fatigued and have nausea affecting food intake, worsening their condition. Changes in serum and blood cells affect coagulation, as well as the immune cells' production of cytokines and immunoglobulin. The blood cells interactions affect all major organ systems. Nutrition and food plays a key role in the health of blood cells and their functions. Vitamins and minerals, such as vitamin E, C and iron, affect the production of blood cells and their proteins, including hemoglobin. In addition, other nutrients, like glutamine, L-carnitine and the amino-acid taurine, play a crucial role in the production of blood cells and blood/related diseases. This book discusses nutritional therapies concerning stem cell transplantation, iron deficiency, cardiovascular diseases, sickle cell anemia and sepsis patients, among others. Nutritional therapy and management in leukemia is given a major focus. The key goal of this handbook is to review some of the nutritional approaches for efficacy in treatment of blood diseases, reduction of their clinical complications and the improvement of the quality of life of these patients.
