Psycholinguistic research into the perception and production of speech has produced results that challenge current conceptions about phonological structure. Field work studies provide fresh insights into the structure of phonological features, and the phonology-phonetics interface is investigated in phonetic research involving both segments and prosody, while the role of underspecification is put to the test in automatic speech recognition.

These topics are followed by discussions of the physical and physiological aspects of tone, the number of possible contrastive tones in a language, and a suprasegmental representation of tones based on linguistic evidence. This text also summarizes the kinds of tone rules found in languages and the important syntactic function played by tone in a number of the world's languages, particularly those in Africa. The final chapters look into the general and specific principles that constrain historical tone change. This book will prove useful to students with phonology course.

There are also up-to-date separate chapters on language and the brain, computational linguistics, writing, child language acquisition, and second-language learning. The breadth of the textbook makes it ideal for introductory courses on language and linguistics offered by departments of English, sociology, anthropology, and communications, as well as by linguistics departments.
