Compressed air has many applications in industry. Delivering compressed air to a manufacturing facility is an expensive operation and it requires costly equipment that consumes significant amounts of electricity and needs frequent maintenance. Roughly 80 to 90 percent of the electricity used to operate compressed air systems is converted to low-temperature waste heat. This lost energy can quickly add up, each year costing individual facilities as much as double the purchase and installation cost (first-cost) of the entire system. The ideal time to think about your compressed air system is before it is installed. Air Compressors deserve independent treatment due to many reasons. There is a wider choice of different types of compressor designs each operating at different efficiencies and suitable for specific application. The type of compressor decided upon has direct implications on the lifetime energy costs. Also the decision as to a single compressor of large capacity versus multi-compressor installation where each compressor has a smaller capacity than the demand influences the possible energy savings considerably. This 6 -hour Quick Book Course provides comprehensive information on the compressed air systems. This course is relevant to anyone needing to know more about compressed air production and use, relevant health and safety issues, legislation and energy efficiency. Previous knowledge of the subject is not required. The book includes a multiple type quiz comprising 30 questions at the end. Learning Objective At the conclusion of this course, the student will: * Understand various types of compressors; their applications, advantages and limitations; * Understand various types of system controls - their pros and cons; * Understand how the control systems are matched to the needs of the users; * Understand the key components of compressed air system and learn how each component function; * Understand the air storage, air drying, piping, filtration and air cleaning methods; * Understand the limits of dew point suppression in refrigerant and desiccant dryers; * Understand the different types of filters and how coalescing filters benefit in removal of lubricant and moisture; * Understand the difference between SCFM, ICFM and ACFM; * Understand the pros and cons of single loop verses ring main systems; * Understand how to quantify and select appropriate compressor for base and trim demand; * Understand what features to specify and what information to seek when making a compressed air proposal; * Understand the compressed air system assessment procedure and energy audit methodology; * Understand the common losses in compressed air systems and the ways to conserve energy; * Understand the routine maintenance schedule for air compressors; * Learn a generic checklist for energy efficiency in compressed air system; * Understand the engineering formulae and technical relationship between compressor motor power-draw and process variables; and * Learn by example the method for evaluating compressed air costs.

Industrial high pressure processes open the door to many reactions that are not possible under 'normal' conditions. These are to be found in such different areas as polymerization, catalytic reactions, separations, oil and gas recovery, food processing, biocatalysis and more. The most famous high pressure process is the so-called Haber-Bosch process used for fertilizers and which was awarded a Nobel prize. Following an introduction on historical development, the current state, and future trends, this timely and comprehensive publication goes on to describe different industrial processes, including methanol and other catalytic syntheses, polymerization and renewable energy processes, before covering safety and equipment issues. With its excellent choice of industrial contributions, this handbook offers high quality information not found elsewhere, making it invaluable reading for a broad and interdisciplinary audience.

This is the Bible of Poker, the book that every serious poker player has read and studied. Walter Browne, chess grandmaster and professional poker player, read and studied this book. Herbert O. Yardley, whose training in, and mastery of, the subtleties of poker made him just the kind of agile thinker whom you would expect to crack the Japanese Diplomatic Code (he did) and to write the classic book on codes, ciphers and spies (*The American Black Chamber*) Here is what the boys in back will have: This book talks about poker and people the way poker players talk about poker and people. It is lusty, funny, cool and knowing. The anecdotes are probably not for your Aunt Hermine. The poker instruction is for anyone (possibly including your Aunt Hermine) who likes to walk away from an all-night session a winner. Each chapter begins with a superb poker story story. Then comes a scientific analysis of the type of poker that was being played. (For example, the story of the corn grower who bets his farm against a circus tent show at Five-Card Draw, Deuces Wild - and wins under the fortunate circumstance of no longer being alive at the time - is followed by a brilliant analysis of how to play your cards at Five Cards Draw, Deuces Wild.) The author's tales of his early training in poker (in his teens when he was the protege of the celebrated Monty, who ran the only clean game in the only clean saloon in his section of the old West) amount to a professional education in the theory and practice of winning. His adventures in the Orient (in between assignments as a secret agent Yardley relaxed his mind - and in a sense repaid his debt to Money - by teaching a young Chinese boy strategic poker) are a post-graduate course in the art of the bluff - how to manage it artistically and successfully - whether the stake is a nest of Nazi spies or a big pot in Seven-Card Stud, Hi-Lo, plus just about every other poker variation you could name.

This book summarizes the "interim result" of the servitization activities in manufacturing industries. While the early literature on servitization tended to stress only its advantages, more recently, scholars have also started to refer to the challenges associated with servitization. This book attempts to give a balanced picture of servitization. The book is structured in four parts: Part I introduces the topic by presenting the most recent academic discussion about servitization and uses an empirical analysis to show the degree of servitization across Europe. The results of this analysis are then compared to the discussion in the literature. This comparison highlights the existing discrepancies between the rather euphoric literature and the more skeptical practical experience. The second and third parts attempt to explain these discrepancies by taking as a starting point the assumption that servitization recommendations have to consider the heterogeneity of the manufacturing sector and the capabilities of the provider. Part II presents articles which analyze the specific characteristics of different sectors with their barriers and potentials and presents frameworks for a successful servitization of the core sectors in European manufacturing industries which include, e.g. aeronautics, automotive, ICT, chemical industries, pulp and paper industries and different engineering sectors. Part III focuses on companies' capabilities which are necessary for successful servitization. These include strategic management, marketing, organization, innovation, engineering, human resources, controlling, quality and networks. All the contributions in parts II and III add up to a detailed picture of servitization for sectors and functions and indicate the practical implications for enterprises in manufacturing industries. The fourth part concludes the book with a chapter summarizing the findings and giving an outlook of servitization in manufacturing industries, its challenges and future developments.

Distillation has historically been the main method for separating mixtures in the chemical process industry. However, despite the flexibility and widespread use of distillation processes, they still remain extremely energy inefficient. Increased optimization and novel distillation concepts can deliver substantial benefits, not just in terms of significantly lower energy use, but also in reducing capital investment and improving eco-efficiency. While likely to remain the separation technology of choice for the next few decades, there is no doubt that distillation technologies need to make radical changes in order to meet the demands of the energy-conscious society. *Advanced Distillation Technologies: Design, Control and Applications* gives a deep and broad insight into integrated separations using non-conventional arrangements, including both current and upcoming process intensification technologies. It includes: Key concepts in distillation technology Principles of design, control, sizing and economics of distillation Dividing-wall column (DWC) – design, configurations, optimal operation and energy efficient and advanced control DWC applications in ternary separations, azeotropic, extractive and reactive distillation Heat integrated distillation column (HIDiC) – design, equipment and configurations Heat-pump assisted applications (MVR, TVR, AHP, CHRP, TAHP and others) Cyclic distillation technology – concepts, modeling approach, design and control issues Reactive distillation – fundamentals, equipment, applications, feasibility scheme Results of rigorous simulations in Mathworks Matlab & Simulink, Aspen Plus, Dynamics and Custom Modeler Containing abundant examples and industrial case studies, this is a unique resource that tackles the most advanced distillation technologies – all the way from the conceptual design to practical implementation. The author of *Advanced Distillation Technologies*, Dr. Ir. Anton A. Kiss, has been awarded the Hoogewerff Jongerenprijs 2013. <http://www.hoogewerff->

Offers a coherent strategy for ending oil dependence, starting with the United States but applicable worldwide. There are many analyses of the oil problem. This synthesis is the first roadmap of the oil solution, one led by business for profit, not dictated by government for reasons of ideology. This roadmap is independent, peer-reviewed, written for business and military leaders, and co-funded by the Pentagon. It combines innovative technologies and new business models with uncommon public policies: market-oriented without taxes, innovation-driven without mandates, not dependent on major (if any) national legislation, and designed to support, not distort, business logic.
