Advances and Applications in Mobile Computing offers guidelines on how mobile software services can be used in order to simplify the mobile users' life. The main contribution of this book is enhancing mobile software application development stages as analysis, design, development and test. Also, recent mobile network technologies such as algorithms, decreasing energy consumption in mobile network, and fault tolerance in distributed mobile computing are the main concern of the first section. In the mobile software life cycle section, the chapter on human computer interaction discusses mobile device handset design strategies, following the chapters on mobile application testing strategies. The last section, mobile applications as service, covers different mobile solutions and different application sectors.

Covers the tasks most crucial to advanced administration including mail services, NIS+ naming service, Automounter Services, Service Access Facility, shell programming, and system security.

Real Time Digital Control Applications is a compilation of papers presented at the Symposium on Real-Time Digital Control Applications, sponsored by the International Federation of Automatic Control (IFAC) and the International Federation for Information Processing (IFIP), held in Guadalajara, Mexico. The event is organized to provide developing countries with the opportunity to gain insights -- from the sharing of ideas and experiences of experts from around the world to the rapid growth and development of applications of real-time digital control systems, which is considered as the basis of industrial revolution. The book presents and discusses the various scientific, industrial, and

NT as an Operating System Microsoft developed Windows NT as an alternative to Unix. The company sees it as a part of its overall Enterprise Computing plan. It scales up from basic 486 systems to high-end RISC systems from companies like Digital, NEC, and PC vendors offering PowerPC systems for NT. The basic operating system consists of a user interface shell (similar in appearance to Windows 3.1 for NT 3.1 to 3.5, and changing to look and feel more like Windows 95 for NT 4.0) designed to run 32-bit programs. This makes it ideal for the multi media nature of Web browsers, and for the heavy-duty requirements of a Web server. There are a number of elements in the OS that are special to NT. These include the control panels and administrative support tools relating to NT's services and support mechanisms. TCP/IP is included for Internet access through traditional networks. You can also connect from Windows NT Workstation via MS Remote Access to any Internet Access Provider supporting PPP. Basic requirements for Windows NT Workstation are a 486 system with at least 8 MB of RAM, although 16 MB is recommended. The client software needed to connect to a corporate server is included, as is the Remote Access software
