Christopher Shaw, the book's author said, "Through preferential postage rates for nonprofits
the Postal Service facilitates civic involvement and a healthy democracy." Nader also noted,
"Postal employees are fairly remunerated in an increasingly low-wage, low benefit 'Wal-Mart'
economy." According to Nader, "Post offices serve as the heart of community life in
neighborhoods and towns nationwide and the presence of postal workers on community
streets make them safer, as the many beneficiaries of their frequently heroic efforts attest."
"The lack of citizen-consumers' involvement in the recently passed postal reform legislation
has highlighted the need for a public dialogue about the future of our postal system. The book
provides a starting point for that conversation," stated Nader.

A test preparation guide for the Humanities.

A revised edition prepares candidates for the postal service application process and Test 473, in a resource that provides four complete practice exams, a targeted review for each test section, and a thorough assessment and overview of the USPS hiring process. Original.

During the past decade there has been an explosion in computation and information technology. With it have come vast amounts of data in a variety of fields such as medicine, biology, finance, and marketing. The challenge of understanding these data has led to the development of new tools in the field of statistics, and spawned new areas such as data mining, machine learning, and bioinformatics. Many of these tools have common underpinnings but are often expressed with different terminology. This book describes the important ideas in these areas in a common conceptual framework. While the approach is statistical, the emphasis is on concepts rather than mathematics. Many examples are given, with a liberal use of color graphics. It should be a valuable resource for statisticians and anyone interested in data mining in science or industry. The book's coverage is broad, from supervised learning (prediction) to unsupervised learning. The many topics include neural networks, support vector machines, classification trees and boosting---the first comprehensive treatment of this topic in any book. This major new edition features many topics not covered in the original, including graphical models, random forests, ensemble methods, least

angle regression & path algorithms for the lasso, non-negative matrix factorization, and spectral clustering. There is also a chapter on methods for “wide” data (p bigger than n), including multiple testing and false discovery rates. Trevor Hastie, Robert Tibshirani, and Jerome Friedman are professors of statistics at Stanford University. They are prominent researchers in this area: Hastie and Tibshirani developed generalized additive models and wrote a popular book of that title. Hastie co-developed much of the statistical modeling software and environment in R/S-PLUS and invented principal curves and surfaces. Tibshirani proposed the lasso and is co-author of the very successful *An Introduction to the Bootstrap*. Friedman is the co-inventor of many data-mining tools including CART, MARS, projection pursuit and gradient boosting.
