Readers are granted a valuable insider's look at the studies that continue to be cited most frequently, stirred up the most controversy when they were published, sparked the most subsequent related research, opened new fields of psychological exploration, and changed most dramatically our knowledge of human behavior. For individuals with an interest in an introduction to psychology.

"This book is designed to help students organize their thinking about psychology at a conceptual level. The focus on behaviour and empiricism has produced a text that is better organized, has fewer chapters, and is somewhat shorter than many of the leading books. The beginning of each section includes learning objectives; throughout the body of each section are key terms in bold followed by their definitions in italics; key takeaways, and exercises and critical thinking activities end each section"--BCcampus website.

Why Things Go Right. The Science of Psychology: An Appreciative View by Laura King (University of Missouri at Columbia) is the first text to bring a truly appreciative view of psychology-as a science and for exploring behavior-to introductory students. It is built around the idea that students must study the discipline of psychology as a whole, that the sub-disciplines are intricately connected, and that human behavior is best understood by exploring its functioning state in addition to its potential dysfunctions. For example, imagine that you have been asked to create a science of "watchology." You have two watches that both have had the unfortunate "trauma" of being left in the pocket of someone's jeans through the washer and dryer. One watch has suffered the worst possible fate-it no longer tells time. The other has emerged from the traumatic event still ticking. Which watch would you use to develop your new science of watchology? Clearly, the working watch will help you understand watches better than the broken one. What does watchology have to do with psychology? Quite simply, in psychology as in watchology, it makes sense to start with what works: to gain a general understanding of human behavior and then apply that knowledge to those who have emerged from life's

experiences in dysfunction.

Excerpt from book: CHAPTER II The Evidence Of Mind 6. Inferring Mind from Behavior In the last chapter we saw that some recent writers upon animal behavior and its interpretation, while refusing to admit the presence of consciousness in all forms of animal life, yet hold that it can be proved to exist in certain forms. The latter, it is maintained, display certain peculiarities of behavior that may be regarded as proofs of a psychic accompaniment. Into the nature of these proofs we may now inquire. To begin with, can it be said that when an animal makes a movement in response to a certain stimulus, there is an accompanying consciousness of the stimulus, and that when it fails to move, there is no consciousness ? Is response to stimulation evidence of consciousness ? In the case of man, we know that absence of visible response does not prove that the stimulus has not been sensed; while it is probable that some effect upon motor channels always occurs when consciousness accompanies stimulation, the effect may not be apparent to an outside observer. On the other hand, if movement in response to the impact of a physical force is evidence of consciousness, then the ball which falls under the influence of gravity and rebounds on striking the floor is conscious. Nor is the case improved if we point out that the movements which animals make in response to stimulation are not the equivalent in energy of the stimulus applied, but involve the setting free of energy stored in the animal as well. True, when a microscopic animal meets an obstacle in its swimming, and darts backward, the movement is not a mere rebound; it implies energy contributed by the animal's own body. But just so an explosion of gunpowder is not the equivalent in energy of the heat of the match, the stimulus.

Sandra Hockenbury and new coauthor Susan Nolan's remarkable textbook is grounded in the belief that all kinds of

students can develop a real understanding of psychology and lasting scientific literacy. The authors act on that belief by using relatable personal stories to communicate the concepts of psychological science (and the process of science itself), and by presenting important research in a clear not oversimplified way. Hockenbury and Nolan also take full advantage of online learning, creating activities in LaunchPad that have students thinking about psychology as scientists do. New co-author, Susan Nolan of Seton Hall University was recently designated a Master Teacher by the Society for Teaching Psychology. Providing a thorough review and synthesis of work on communication skills and skill enhancement, this Handbook serves as a comprehensive and contemporary survey of theory and research on social interaction skills. Editors John O. Greene and Brant R. Burleson have brought together preeminent researchers and writers to contribute to this volume, establishing a foundation on which future study and research will build. The handbook chapters are organized into five major units: general theoretical and methodological issues (models of skill acquisition, methods of skill assessment); fundamental interaction skills (both transfunctional and transcontextual); function-focused skills (informing, persuading, supporting); skills used in management of diverse personal relationships (friendships, romances, marriages); and skills used in varied venues of public and professional life (managing leading, teaching). Distinctive features of this handbook include: \* broad, comprehensive treatment of work on social interaction skills and skill acquisition; \* up-to-date reviews of research in each area; and \* emphasis on empirically supported strategies for developing and enhancing specific skills. Researchers in communication studies, psychology, family studies, business management, and related areas will find this volume a comprehensive, authoritative source on communications skills and their enhancement, and it will be essential reading for scholars and students across the spectrum of disciplines studying social interaction.

Matthew Johll's Exploring Chemistry covers the standard topics for the nonmajors course in the typical order, but each chapter unfolds in the context of a single case study that helps students connect what they are learning to real-life situations. For example, students work through the often-difficult topics of molecular structure, gas laws, and organic chemistry by learning about the development of powerful new chemotherapy drugs, new technologies for screening airline passengers, and the creation of biodegradable biopolymers. It's the same case-driven approach that Johll uses in his acclaimed Investigating Chemistry (now in its Third Edition) but Exploring Chemistry goes beyond the other book's specific focus on examples from forensic science to use real-life stories from cooking, athletics, genetics, green chemistry, and more.

In our culture, watching movies is a universal experience but understanding film may not be. The Film Experience

The book's features Form in Action, Film in Focus, and Concepts at Work combine text, stills, and links to videos online to explore specific films, scenes, and trends in depth.

In this fresh new offering to the Intro Psychology course, authors John Cacioppo and Laura Freberg portray psychology as being an integrative science in two ways. First, they have written a text that reflects psychology's rightful place as a hub science that draws from and is cited by research in many other fields. Second, this text presents psychology as a unified science that seeks a complete understanding of the human mind, rather than as a loosely organized set of autonomous subspecialties. As psychology moves rapidly toward maturity as an integrative, multidisciplinary field, the introductory course offers an opportunity to teach all of psychology in one place and at one time. This text reflects that evolution--and the authors' excitement about it.
