From nineteenth-century public baths to today's private backyard havens, swimming pools have long been a provocative symbol of American life. In this social and cultural history of swimming pools in the United States, Jeff Wiltse relates how, over the years, pools have served as asylums for the urban poor, leisure resorts for the masses, and private clubs for middle-class suburbanites. As sites of race riots, shrinking swimsuits, and conspicuous leisure, swimming pools reflect many of the tensions and transformations that have given rise to modern America.

This thesis describes the occurrence of microbial and chemical contaminants in swimming pools and the investigation of an alternative disinfection technology, UVOX Redox® that could reduce reliance on chlorine and the formation of chlorinated disinfection byproducts (DBPs) in swimming pools. This technology was effective in inactivation of chlorine resistant microorganisms, represented by *Bacillus subtilis* spores, and in combination with chlorine generated lower concentrations of chlorinated DBPs compared to chlorination alone. It enhanced the removal of pharmaceuticals and personal care products (PPCPs), which were frequently present in indoor, outdoor and spa pools. Carbamazepine and 1H-benzotriazole were the most frequently detected PPCPs, while hydrochlorothiazide and 4-methylbenzylidene camphor were detected at the highest concentration. An investigation of seven different swimming pool facilities showed that clinically relevant fungi were omnipresent. Floors at the sites where the pool visitors converge, such as the exit leading to shower rooms, showed the highest fungal concentrations. The distribution of fungi inside the swimming pool facilities highlighted potential transmission pathways and a possible risk of fungal infections. Future swimming pool water guidance should include raising awareness among swimmers, pool operators and managers about hygienic behaviour and better hygiene measures, and application of alternative disinfection technologies such as UVOX. Key features: Identifies clinically relevant fungi in swimming pool environments Identifies potential transmission pathways of clinically relevant fungi in indoor swimming pools Highlights the occurrence of PPCPs in different type of pools and their relation with pool water treatment Assesses an alternative disinfection technology for swimming pool water treatment.

The pool is an aspirational motif that recurs across the history of residential architecture, no matter which era or location. In *Pools: Design and form with water*, renowned photographer Miquel Tres' spectacular full-color images and detailed narratives showcase a wide selection of pool designs from around the world. This book features a multitude of examples in a wide range of styles: natural chemical-free pools with purifying systems; rustic pools which use local materials and natural depuration methods in sometimes rural settings; contemporary dazzlers and designer pools for interior and exterior spaces, including illuminated designs and other modern features. *Pools* will help the aspiring landscape or interior designer to determine the latest trends and to consider strong garden contexts and landscape planning, outdoor pool-site plans, materials and furniture.

Public swimming pools and spas with certified operators had significantly fewer violations per inspection than did the public swimming pools and spas with operators not certified. There were also significantly

fewer critical violations and immediate closures for the pools and spas with certified operators. These findings suggest that pool operator certification is a useful tool in increasing compliance, thus protecting public health.

The exemption for interconnection of smoke alarms in existing areas has been deleted. New girder/header tables have been revised to incorporate the use of #2 Southern Pine in lieu of #1 Southern Pine.
