drug infusions, local anesthetics, and epidural/caudal pediatric guidelines. The initial hours after surgery are a critical time in the care of the surgical patient. Familiarity with the clinical presentation of perioperative complications is important to achieving optimal outcomes. By taking an approach to complications based upon signs and symptoms seen in the early post-operative period among adult patients undergoing non-cardiac surgery, this book aids the practitioner in the clinical management of surgical patients during the often turbulent hours after surgery. After a brief introduction to PACU organization, this manual discusses the common and most serious symptoms encountered in the post-operative patient, giving guidance on diagnosis of the underlying disorder and the treatment options available. The book also includes chapters dedicated to subspecialty patients, including patients requiring post-operative mechanical ventilation, pediatric patients, patients with implantable cardiac devices, morbidly obese patients and the complex pain patient. This practical manual is essential reading for all practitioners working in the PACU environment.

Centers and the organization of Regional and World Congresses, the distribution of practical monographs on some important aspects of anesthesiology were considered important for the attainment of this objective. In 1968, on the occasion of the Fourth World Congress of Anesthesiology, held in London, a monograph on "Emergency Resuscitation", compiled by the Committee on Cardiopulmonary Resuscitation, chaired by Professor HENNING POULSEN, was made available to our membership. Subsequently, this excellent monograph was translated into Spanish, Russian, German and French and to this date over 100,000 copies of it have been distributed to anesthesiologists and other interested physicians the world over. When looking for a suitable topic for a second monograph to commemorate the 1972 World Congress of Anesthesiology to be held in Kyoto this September, the subject of Obstetric Analgesia and Anesthesia was the first choice of almost everyone consulted. For reasons that are hard to condone, obstetric analgesia and anesthesia has often been the step child among the anesthetic subspecialties.
